

## ACCESS CONTROL APPARATUS AND METHOD FOR ELECTRONIC DEVICE

### ABSTRACT OF THE INVENTION

5           A switch for power gating is disposed between an electronic device and its power source. The switch is controlled from a biometric reader that asserts a signal to the switch when a biometric profile matches a stored biometric signature. The gating of the power may thereby activate the electronic device. As the electronic device is isolated from its power source pending a successful biometric verification, it is not possible to  
10   circumvent the access control feature using the resources of the electronic device. Until the biometric reader verifies a biometric profile, the electronic device remains in an unpowered state.
